

Stage-2: One-Page Proposal Instructions

Problem Statement

Make a one-page proposal to address a well-defined healthcare-related problem in the aging population.

Your proposal should clearly explain the problem, your proposed solution, and how it can realistically be implemented to create meaningful impact within the given constraints.

What Your Proposal Should Include

1. Problem Definition & Context

Clearly describe the healthcare problem affecting the aging population that you are addressing. Specify:

- Who is affected
- The setting or context in which the problem occurs
- Why this problem is important and worth solving

The problem should be specific, realistic, and clearly relevant to healthcare and ageing.

2. Goals & Strategic Approach

State the main goal(s) of your proposal. Explain what you aim to achieve and outline the overall strategy you will use to address the problem. Your goals should be clear, achievable, and directly aligned with the problem you have identified.

3. Innovation & System Integration

Describe your proposed solution and highlight any innovative aspects. Innovation does not need to be purely technological. Explain how your solution:

- Fits within existing healthcare systems or workflows
- Engages relevant stakeholders (e.g. patients, caregivers, healthcare providers, community services)
- Uses technology or processes in a meaningful and integrated way

4. Feasibility & Execution Plan

Explain how your solution would be implemented in practice. Provide a high-level execution plan that demonstrates feasibility. This may include:

- Key implementation steps
- A simple timeline or phases
- Practical considerations relevant to the aging population

Your plan should show that the idea can realistically be executed.

5. Impact & Expected Outcomes

Describe the expected quantifiable impact of your solution. Explain:

- Who will benefit and to what extent
- How the impact will be measured
- Why these outcomes matter

Focus on realistic and meaningful outcomes (quantifiable), such as improved quality of life, better access to care, or system efficiency.

6. Budget & Resource Overview

Students are required to **realistically estimate the total budget needed** to implement their proposed solution and provide a **justified breakdown** across major cost areas. The budget should reflect the scale, scope, and feasibility of the proposed execution plan.

The budget should:

- Be **realistic and well-justified**
- Clearly **align with the proposed execution plan and timeline**
- Demonstrate **cost awareness and responsible use of resources**
- Avoid unnecessary or excessive spending that is not critical to impact

A **high-level budget breakdown** is sufficient. A detailed financial model is **not required**, but major cost categories (e.g., technology, staffing, training, operations, evaluation) should be clearly identified and explained.

General Submission Guidelines

- The proposal must be **exactly one (1) page** (executive summary style)
- **Font:** Aptos (Body)
- **Font size:** 12 pt
- **Spacing:** Single-spaced
- Use **clear headings** to structure your proposal
- Focus on **clarity, coherence, and practicality** rather than technical depth
- Any assumptions made should be reasonable and clearly implied

Important Note

Submissions that exceed one page or do not follow the formatting requirements may be penalized.

Marking Scheme

Category (Weight)	Poor (1–2)	Fair (3–4)	Good (5–6)	Very Good (7–8)	Excellent (9–10)
Problem Definition & Contextual Relevance (10%)	Problem is vague, generic, or poorly defined; little or no relevance to healthcare or ageing context	Problem identified but broad, weakly scoped, or lacks clear context	Problem reasonably defined with basic relevance and context	Problem clearly defined, specific, and well-contextualized	Problem sharply defined, compelling, and grounded in real-world ageing challenges
Goals & Strategic Approach (20%)	Goals unclear or unrealistic; no coherent strategy	Goals present but poorly aligned or weakly justified	Clear and achievable goals with a basic, logical strategy	Well-defined goals with a coherent, realistic strategy	Precise, measurable goals supported by a robust, well-reasoned strategy
Innovation & System Integration (20%)	No meaningful innovation; solution disconnected from systems or stakeholders	Limited or superficial innovation; weak integration	Moderate innovation with basic integration of systems or stakeholders	Thoughtful innovation with clear, effective system integration	Highly compelling innovation with seamless integration across technology, processes, and stakeholders
Feasibility, Timeline & Execution Plan (20%)	Plan unrealistic or infeasible; no clear execution path	Partial plan with major gaps or unclear timeline	Feasible plan with a basic timeline and execution logic	Well-structured, realistic execution plan with clear timeline	Highly feasible, detailed execution plan demonstrating strong operational understanding
Impact & Outcome Potential (20%)	Impact unclear, minimal, or speculative	Limited or poorly articulated impact	Reasonable impact with identifiable beneficiaries	Strong potential impact with clear benefits	High-impact solution with compelling, scalable outcomes
Budget & Resource Justification (10%)	Budget missing, unrealistic, or unjustified	Budget provided but poorly aligned or weakly justified	Reasonable budget aligned with activities	Well-structured budget clearly aligned with execution plan	Highly coherent, realistic budget with excellent justification and alignment

Note to Students

Below is an exemplary one-page proposal. This example demonstrates **clarity, quantification, and feasibility** within a one-page limit. Your proposal does not need identical numbers but should reflect the same level of structure and realism.

Example One-Page Proposal

Problem Definition & Context

Falls are a leading cause of injury among adults aged 65+, with approximately **30% of older adults experiencing at least one fall each year**. For elderly individuals living alone, delayed detection and response often result in fractures, hospital admissions, and long-term loss of independence. In community settings, response times following a fall can exceed **30–45 minutes**, significantly increasing health risks and healthcare costs. There is a clear need for timely fall detection and coordinated response for independently living older adults.

Goals & Strategic Approach

This proposal aims to **reduce fall-related injury severity and response time** for older adults living independently. The key objectives are to detect falls within **30 seconds**, reduce response time by **at least 50%**, and improve coordination between elderly users, caregivers, and healthcare providers. The strategy combines real-time monitoring with automated alerts and a structured escalation process.

Innovation & System Integration

The proposed solution uses a **wearable fall-detection device** integrated with a mobile and cloud-based platform. When a fall is detected, alerts are automatically sent to caregivers, with escalation to community health services if no response occurs within a defined time window. The system integrates into existing care workflows by enabling incident summaries to be shared with primary care providers, supporting follow-up and preventive interventions.

Feasibility & Execution Plan

The project will be implemented over **12 months** in three phases:

Phase	Timeframe	Key Activities
Phase 1: Setup & Planning	Months 1–3	Device selection, platform setup, stakeholder onboarding
Phase 2: Pilot Deployment	Months 4–8	Deployment to 100 elderly users, caregiver training, system testing
Phase 3: Monitoring & Refinement	Months 9–10	Performance monitoring, issue resolution, minor enhancements
Phase 4: Evaluation & Scale Planning	Months 11–12	Impact assessment, outcome reporting, scale-up planning

The solution leverages commercially available devices and lightweight software development, making implementation realistic within scope and budget.

Impact & Expected Outcomes

The pilot is expected to reduce average fall response time from **~45 minutes to under 20 minutes**, leading to fewer complications and an estimated **15–20% reduction in fall-related hospital admissions** among participants. Elderly users benefit from increased safety and confidence, while caregivers gain improved visibility and response capability.

Budget & Resource Overview

Category	USD
Wearable devices (100 users)	30,000
Software & platform development	35,000
Cloud & data services	10,000
Training & onboarding	10,000
